

Shop Afrik

Project Plan and Technical Roadmap

A professional planning brief for building Shop Afrik as a full African e-commerce marketplace integrated with QR Wallet business payments.

Field	Details
Document type	Product plan, architecture brief, and implementation roadmap
Prepared for	Shop Afrik project kickoff
Version	Planning draft 1.0
Date	June 5, 2026
Source material	Existing Shop Afrik specs, QR Wallet integration plans, and visual color reference

Planning Position

Start with a focused marketplace MVP: buyer shopping, seller product management, admin approvals, QR Wallet pay-now checkout, order tracking, refunds, and day-8 seller settlement. Defer deep links and pay-on-delivery until the core marketplace flow is stable.

1. Executive Summary

Shop Afrik is planned as a full multi-seller e-commerce marketplace for African markets. The first release should prove the core marketplace loop: discover a product, place an order, pay through QR Wallet, fulfill the order, handle refunds within a clear window, and settle sellers after the refund period.

Recommended MVP

Build a mobile-first Flutter marketplace backed by a dedicated Shop Afrik Firebase project. Use QR Wallet merchant QR payment for v1, require seller KYC through QR Wallet, and hold proceeds in the Shop Afrik business wallet until day 8 after delivery.

2. Product Vision

Shop Afrik should feel like a trusted African commerce platform: practical enough for everyday shopping, strong enough for seller operations, and disciplined enough for payments, refunds, and admin control.

- Buyers can discover products, compare options, pay securely, track orders, and request refunds.
- Sellers can onboard, upload products, manage stock, process orders, and monitor earnings.
- Admins can approve sellers and products, manage refunds, configure commissions, view reports, and investigate risk.
- QR Wallet remains the payment foundation while Shop Afrik owns the e-commerce experience.

3. Product Scope

Area	MVP Scope	Deferred
Buyer app	Auth, catalog, product detail, cart, QR checkout, orders, refunds, wishlist, reviews	Live chat, flash sales, comparison, price-drop alerts
Seller dashboard	Seller onboarding, KYC check, product CRUD, inventory, order updates, payout visibility	Bulk CSV upload, analytics, coupons, vacation mode
Admin dashboard	Seller/product approval, order overview, refund control, commission settings, audit logs	A/B tests, advanced fraud scoring, warehouse operations
Payments	QR Wallet merchant QR pay-now flow, business wallet collection, refunds, day-8 settlement	Deep link handoff, pay on delivery, non-wallet payment methods
Logistics	Basic delivery statuses and delivery fee model	Courier app, live GPS dispatch, warehouse inspection tooling

4. Platform Architecture

The recommended architecture is a separate Shop Afrik app and Firebase backend integrated with QR Wallet through Cloud Functions. This keeps the wallet product stable while giving Shop Afrik freedom to evolve marketplace data, seller workflows, and admin controls.

Layer	Responsibility
Shop Afrik Flutter app	Buyer, seller, and admin experiences. Mobile-first, with admin web support when needed.
Shop Afrik Firebase project	Products, categories, orders, buyers, sellers, reviews, refunds, notifications, audit logs, and settlement records.
Shop Afrik Cloud Functions	Order creation, QR payload generation, payment confirmation, settlement jobs, refund workflow, seller/admin permissions.
QR Wallet Firebase project	Business wallet, wallet balance, QR signing, sendMoney, refunds, holds, withdrawals, and existing KYC/wallet infrastructure.

Architecture Decision

Use the QR Wallet business wallet pattern, not a QR Wallet tenant refactor. The existing planning documents identify this as lower risk because it reuses established QR Wallet functions while keeping new Shop Afrik logic additive.

5. QR Wallet Payment Flow

- 1 Buyer adds items to cart in Shop Afrik and starts checkout.
- 2 Shop Afrik calculates subtotal, payment fee, delivery fee, and total.
- 3 Shop Afrik calls QR Wallet's signed QR payload function for the Shop Afrik business wallet.
- 4 Buyer opens QR Wallet, scans the QR code, confirms payment, and enters PIN.
- 5 QR Wallet sendMoney debits the buyer and credits the Shop Afrik business wallet.
- 6 Shop Afrik detects the transaction, marks the order as paid, and begins fulfillment.
- 7 After delivery and the 7-day refund window, Shop Afrik settles the seller share to the seller's QR Wallet.

6. Money, Refunds, and Settlement

Policy	Recommendation
Commission	Start at 15 percent, configurable globally and later per category.
Payment fee	Buyer pays payment processing fee as a separate checkout line item.
Refund window	7 days from courier-confirmed delivery.

Policy	Recommendation
Partial refunds	Allowed for multi-item orders; single-item orders are full refund or no refund.
Settlement	Day 8 auto-settlement to seller QR Wallet after refund window closes.
Seller KYC	Required through QR Wallet before seller approval.
Admin escalation	Use tiered refund approval based on refund amount and admin role.

7. Core Data Model

Collection	Purpose
products	Catalog records with seller, price, images, stock, category, and approval status.
categories	Category tree for browse, filters, and admin management.
orders	Buyer order totals, payment status, delivery status, timestamps, and settlement status.
sellers	Store profile, QR Wallet link, KYC status, rating, approval status, and payout settings.
buyers	Customer profile, addresses, wishlist, and notification preferences.
reviews	Verified-buyer product reviews and ratings.
refund_requests	Buyer refund requests, evidence, inspection result, admin decisions, and escalation state.
settlements	Day-8 payout records from Shop Afrik to sellers.
notifications	In-app notification history for buyers, sellers, and admins.
admin_audit	Append-only audit trail for admin and financial actions.

8. Visual Direction

The visual reference points toward a premium dark mobile interface with teal action states, soft aqua highlights, and coral danger states. Shop Afrik should borrow the trust and polish of fintech UI, then add stronger product imagery for the shopping experience.

Token	Hex	Usage
Primary dark	#101418	App background, high-trust surfaces
Panel dark	#171D24	Cards, forms, product panels, bottom sheets
Deep teal	#063F3B	Brand anchor, headers, dark accents

Token	Hex	Usage
Primary teal	#0BA99D	Main buttons, active tabs, payment confirmation
Bright aqua	#3ED1C2	Highlights, success states, gradients
Danger coral	#F56565	Refund warnings, delete actions, failed payment states
Muted text	#9AA4B2	Secondary labels and helper text

9. Build Roadmap

Phase	Outcome	Key Work
Phase 0: Decisions	Ready-to-build scope	Choose countries, Firebase project ID, commission, refund thresholds, delivery model, and initial categories.
Phase 1: Project setup	New app foundation	Create GitHub repo, scaffold Flutter app, connect Firebase, define routing, theme, and base services.
Phase 2: Backend	Marketplace data foundation	Products, sellers, buyers, orders, payment confirmation, state machine, security rules, and Cloud Functions.
Phase 3: Buyer MVP	Customer shopping flow	Home, categories, search, product detail, cart, checkout, QR payment, orders, wishlist, reviews.
Phase 4: Seller MVP	Seller operations	Seller onboarding, product CRUD, inventory, order management, sales and payout visibility.
Phase 5: Admin MVP	Platform control	Approval queues, orders, refunds, commissions, audit logs, reports, and role controls.
Phase 6: Enhancements	Smoother commerce	Deep links, pay on delivery, courier confirmation, advanced notifications, promotions, analytics.

10. Open Decisions

Decision	Recommended Default
Initial countries	Start with Ghana and Nigeria if operations are ready; otherwise Ghana only for faster launch.
Firebase project	Create a dedicated Shop Afrik Firebase project separate from QR Wallet.
Commission	15 percent for MVP, stored as admin-configurable platform setting.
Refund Tier 1	Admin can approve up to NGN 50,000 equivalent.
Refund Tier 2	Admin plus supervisor approval up to NGN 300,000 equivalent.

Decision	Recommended Default
Low stock threshold	20 percent of initial stock or a seller-defined minimum quantity.
Delivery code	Optional in MVP, recommended before scaling courier operations.
Minimum order amount	Decide per country after delivery fee model is selected.
Initial categories	Start with 10 to 15 main categories.
Max products per seller	500 products per seller for v1.

11. Immediate Next Steps

- 1 Approve this planning document or mark changes.
- 2 Choose the final MVP country scope and Firebase project name.
- 3 Create the GitHub repository for Shop Afrik.
- 4 Create the Flutter project and commit the initial scaffold.
- 5 Implement theme tokens, routing shell, Firebase setup, and app role structure.
- 6 Build backend data model and security rules before UI screens rely on live data.
